

IMPORTANT: Use this prompt as the source of truth. Read AGENTS.md in the repo, but if older uploaded docs, PDFs, or session prompts conflict with this prompt, follow this prompt.

CONTINUE FROM THE LAST CODEX SESSION.

DO NOT START OVER.

This is the final recovery/build prompt for the Pickaxe Capital / AI Habitat OS website.

I have worked on this project for the past two days. The current visual direction is finally close to the goal. Your job is to continue from the exact current state, preserve the current design, finish unfinished work, make the command center functional, add the new required systems, validate everything, update project documentation, organize the repo, and prepare the project for GitHub.

This is for CODEX. Focus on code, file structure, working routes, stability, honest labels, validation, and no duplicate systems.

IMPORTANT ABOUT THE ATTACHED IMAGE:

The attached terminal image shows a Docker/production environment with services like frontend, backend, mysql, nginx, and an analysis container restarting because of a Python import error:

ModuleNotFoundError: No module named 'analysis.models.schemas'

Treat that image as a reminder to keep this project organized, validated, and free of broken imports or broken service assumptions.

Do NOT automatically convert this Pickaxe Capital project into Docker.

Do NOT migrate this project to FastAPI, Java, MySQL, nginx, Vite, React, Astro, or another architecture unless the current repo already uses it.

Do NOT mix the “adcheck” or “graduation-project” Docker project with Pickaxe Capital unless it is actually the same repository.

If those files are present in this repo by accident, quarantine/report them instead of integrating them.

This Pickaxe Capital project’s architecture truth remains the source of truth unless local files prove otherwise.

=====

0. FIRST: READ PROJECT CONTEXT BEFORE EDITING

=====

Before editing anything:

1. Read AGENTS.md first.
2. Read PROJECT_STATUS.md second.
3. Read NEXT_STEPS.md if it exists.
4. Inspect active files:

- server.mjs
- public/index.html
- public/app.js
- public/styles.css
- public/habitat-data.js
- package.json if present
- any current validation scripts

Then identify:

- what was unfinished from the previous Codex session
- what files are mid-edit or inconsistent
- what existing data structures already exist
- what existing localStorage keys already exist
- what exact files you plan to touch
- whether the current repo is really the static Node Pickaxe Capital app

Do not start new features until the current unfinished work is stabilized.

=====

1. ARCHITECTURE TRUTH

=====

This is expected to be a static Node app.

Expected active runtime:

- server.mjs serves public/

Expected active files:

- server.mjs
- public/index.html
- public/app.js
- public/styles.css
- public/habitat-data.js
- AGENTS.md
- PROJECT_STATUS.md
- NEXT_STEPS.md if present

The src/ Astro files are reference only unless the current verified runtime proves otherwise.

Do not modify src/ expecting it to affect the running app.

Do not migrate frameworks.

Do not introduce React, Next, Vite, Astro runtime changes, Docker, FastAPI, Java backend, MySQL, nginx, or new frontend frameworks.

Do not install heavy dependencies.

Do not add WebSockets.

Do not add backend APIs unless already present and explicitly required.

Use these commands, not npm, if this is still the Codex Mac environment:

```
/Applications/Codex.app/Contents/Resources/node --run build
```

```
/Applications/Codex.app/Contents/Resources/node --run check:project
```

If those commands do not exist, inspect package.json/scripts and report the correct commands before changing architecture.

=====

2. ORGANIZATION / BROKEN IMPORT SAFETY CHECK

=====

Because the attached screenshot shows a broken Docker/Python import problem, perform a safety organization check:

1. Search for unrelated project folders/files:

- adcheck
- graduation-project
- docker-compose.yml
- Dockerfile
- FastAPI
- uvicorn
- mysql
- nginx
- Java backend
- analysis/models/schemas
- backend/frontend folders not used by Pickaxe Capital

2. If those files are not part of Pickaxe Capital:

- do not integrate them
- do not modify them unless necessary to avoid repo confusion
- report them as unrelated or accidental files
- ensure .gitignore or cleanup recommendations prevent accidental commits

3. If this repo unexpectedly contains Docker/FastAPI services:

- do not guess
- inspect the real file tree

- identify the true active app
- report whether Pickaxe Capital is static Node or a different architecture
- only fix broken imports if they are actually in the Pickaxe Capital repo and needed for validation
- 4. Do not leave broken import paths.
- 5. Do not leave duplicated architecture.
- 6. Do not leave orphaned old files without reporting them.
- 7. Do not fake a pass if validation fails.

=====

3. CURRENT PRODUCT VISION TO PRESERVE

=====

The product is:

Pickaxe Capital / AI Habitat OS

It should feel like:

- luxury cyberpunk founder command center
- CEO B command layer
- AI agent civilization
- Trading Floor / AI Operations Core
- Market Habitat
- Life / Knowledge Habitat
- Archive Intelligence Vault
- Source Hub
- Mission Tracker / Staging
- RK Tracker
- Bookmarks / X Bookmark Intelligence

- local command terminal
- decision operating system

Preserve the current improved visual direction:

- Pickaxe Capital / AI Habitat OS header
- CEO B at the top/center as command layer
- Trading Floor / AI Operations Core in the center
- Market Habitat on the left
- Life / Knowledge Habitat on the right
- agent style factories / character cards
- glowing cyberpunk paths
- Archive Intelligence Vault
- Mission Tracker / Staging
- Ownership Matrix
- CEO B Review Stack
- Integrations Status
- Command Terminal
- bottom status legend/navigation
- dark premium Pickaxe Capital branding

DO NOT:

- start over
- redesign from scratch
- remove CEO B
- remove Trading Floor
- remove Market Habitat / Life Habitat split

- remove agent factory cards
- create duplicate pages
- add fake live data
- add scraping
- add auto-trading
- add API keys
- add voice/camera/device APIs
- add unsafe remote-control features
- install random animation plugins
- migrate frameworks

=====

4. HONESTY CLEANUP

=====

Preserve the design, but correct misleading claims.

A. Remove or correct gamification mechanics:

- LVL labels
- XP bars
- capital counters
- diamond counters
- coin/gem/gamer/rank/loot stats

Replace with:

- build version
- active route
- route count

- last build status
- Static / Prototype / Research / Future Adapter labels

B. Remove or relabel fake live telemetry:

- fake CPU usage
- fake memory usage
- fake GPU load
- fake network throughput
- fake uptime
- fake threat level
- fake “all systems operational” claims unless tied to real build/route verification

Replace with:

- Build Verified
- Routes Verified
- Static Node App
- Prototype UI
- Future Adapter
- Local State
- Last build timestamp if available
- link to /staging

C. Use only these statuses:

- Live = implemented and testable right now
- Static = informational only
- Prototype = local UI/localStorage only
- Research = concept/reference only

- Future Adapter = planned integration, not active

Canonical agent statuses:

- CEO B -> Static
- System Brain -> Prototype
- Signal Scout -> Prototype
- News Raven -> Prototype
- Risk Sentinel -> Prototype
- Macro Watcher -> Research
- Flow Hunter -> Research
- Map Builder -> Prototype
- Bookmark Miner -> Static
- Archive Keeper -> Static
- Wealth Alchemist -> Research
- Task Smith -> Prototype
- Auto Update Agent -> Prototype
- Story Teller -> Static

D. Keep these honest labels:

- CEO B Command Terminal: Local command console. Prototype only.
- Live Operations Feed: Prototype / Local Activity Only
- Integrations Status: Future Adapter / Not Implemented
- No scraping
- No auto-trading
- No API keys in frontend
- No fake live agents

No market/trading/financial agent should be labeled Live or Online unless a real tested integration exists.

=====

5. SHARED LOCAL ACTION SYSTEM

=====

Before adding new UI, consolidate local actions.

Goal:

All local buttons/actions across the site must write to the same CEO B Review Stack / local mission queue.

This shared system should be used by:

- /agents
- /vision-map
- /archive
- /staging
- /market-command
- /signal-engine
- /signals
- /rk-tracker
- /project-update
- /agent-builder-factory
- Quantum Brain workflow
- Market Chart Workspace

Do not create duplicate queues.

Use existing localStorage/data shape if already present.

If no shared system exists, create one carefully.

Preferred localStorage keys:

- localStorage.pickaxeReviewQueue
- localStorage.pickaxeMissionQueue
- localStorage.pickaxeCompletionTracker
- localStorage.pickaxeAgentFactory

Every local action should:

- update shared local queue
- update operations feed if present
- add command terminal feedback if present
- avoid claiming backend execution

Example command terminal feedback:

CEO_B@command: action queued locally

=====

6. COMMAND CENTER FUNCTIONALITY WITH VANILLA JS/CSS

=====

Do not install animation plugins.

Add or improve:

1. Data-flow animations

Subtle animated glow/pulse along lines connecting:

- Market Habitat -> Trading Floor
- Life / Knowledge Habitat -> Trading Floor
- Trading Floor -> CEO B
- CEO B -> Decisions / Missions
- Agent factories -> Trading Floor

- Archive / Staging / Source Hub relationships

Use CSS pseudo-elements or existing DOM elements.

Keep it premium, subtle, and not distracting.

2. Agent card status animation

Agent cards should softly animate based on status:

- Static = calm low glow
- Prototype = medium glow
- Research = amber/purple research glow
- Future Adapter = blue/cyan pending glow
- Live only if truly implemented/testable

3. Hover behavior

When hovering agent cards or command nodes:

- slight lift
- stronger glow
- cursor pointer
- optional related path highlight
- no layout shift

4. Click behavior

Clicking an agent card opens a local detail drawer/panel.

Drawer shows:

- agent name
- role
- class/type
- status

- habitat
- owned route
- owned sources
- current task
- next action
- priority
- risk flag
- CEO B review note

Drawer buttons:

- Add to CEO B Review
- Send to Archive
- Create Task
- Open Route

Use local mock state/localStorage only.

Do not require backend.

5. Operations feed local updates

When actions are clicked, append local feed entries.

Examples:

- Signal Scout sent candidate to CEO B Review.
- Archive Keeper added item to Archive queue.
- Task Smith created a local build task.
- System Brain logged a prototype action.

Label:

PROTOTYPE / Local Activity Only

6. Reduced motion

Add prefers-reduced-motion support in CSS:

```
@media (prefers-reduced-motion: reduce) {  
  
  reduce or disable non-essential animations  
  
}
```

=====

7. URGENT PRIORITY: FOCUS MARKET WATCHLIST ONLY

=====

This is urgent and important.

For now, Market Habitat / Signal Scout / RK Tracker / Market Command / Signal Engine / Signals pages should focus ONLY on this watchlist until B adds more symbols later.

Do not add random tickers.

Do not create a giant unrelated market dashboard.

Do not add unrelated assets.

Do not fake live prices.

Do not claim real-time data unless a real tested data adapter exists.

Do not make trading recommendations.

Do not enable trading execution.

Canonical watchlist:

Core Crypto / ETF / Equity Watchlist:

- BTC — Bitcoin
- SPY — SPDR S&P 500 ETF
- QQQ — Invesco QQQ Trust
- TSLA — Tesla
- AAPL — Apple

- AMD — Advanced Micro Devices
- NVDA — Nvidia
- MSFT — Microsoft
- AMZN — Amazon
- UVXY — ProShares Ultra VIX Short-Term Futures ETF

Index / Futures / Macro Watchlist:

- SPX — S&P 500 Index
- MESmain — Micro E-mini S&P 500 futures
- GCmain — Gold futures
- SImain — Silver futures
- SICmain — 100-Ounce Silver futures
- CLmain — Crude Oil futures
- DXY — US Dollar Index

Important:

The screenshots are reference images for the exact watchlist and visual style only.

Do not hardcode screenshot prices as current truth.

If using placeholder prices, label them clearly:

Static Snapshot / Placeholder / Manual Watchlist

Preferred labels:

- Static Watchlist
- Manual Snapshot
- Future Market Data Adapter
- No Live Feed Connected
- CEO B Review Required

Create or update a canonical marketWatchlist array in public/habitat-data.js if centralized data exists.

Each item should include:

- symbol
- name
- assetClass
- group
- status
- purpose
- ownerAgent
- route
- priority
- notes

Use this shared marketWatchlist across:

- /market-command
- /signal-engine
- /signals
- /rk-tracker
- /vision-map market sections
- /project-update
- /staging
- /ai-handoff

Market grouping:

Group 1: Core Risk Assets

- BTC

- SPY
- QQQ
- TSLA
- AAPL
- AMD
- NVDA
- MSFT
- AMZN

Group 2: Volatility / Hedge

- UVXY

Group 3: Macro Index / Futures

- SPX
- MESmain
- DXY

Group 4: Commodities

- GCmain
- SImain
- SICmain
- CLmain

Market UI should support:

- Add to CEO B Review
- Create Signal Task
- Send to Archive
- Add note

- Mark Needs Research

Use language:

- Watch

- Review

- Research

- Add note

- Create task

- Send to CEO B Review

Do not use:

- Buy now

- Sell now

- Guaranteed

- Autotrade

- Execution ready

- Live signal

=====

8. MARKET CHART WORKSPACE

=====

B uses a mobile market chart workflow when watching markets.

Create or improve a Market Chart Workspace inspired by the provided QQQ screenshot.

Use the screenshot only as workflow/style reference.

Do not copy the broker app exactly.

Do not use copyrighted broker branding/layout exactly.

Do not add trading execution.

Do not add fake live prices.

Do not hardcode screenshot prices as current truth.

Do not create Buy/Sell/Trade execution buttons.

Preferred routes/pages to update:

- /market-command
- /signal-engine
- /signals
- /rk-tracker
- /vision-map market sections
- /project-update
- /staging
- /ai-handoff

Default selected symbol:

QQQ — Invesco QQQ Trust

But do not hardcode the screenshot price as live truth.

If showing sample numbers, label them:

Manual Snapshot Example

Better:

Leave numeric fields blank/manual unless existing static sample data already exists.

Market Chart Workspace UI should include:

1. Symbol Header

- selected symbol
- full name
- asset class

- group
- status label: Static Watchlist / Future Market Data Adapter
- owner agents: Signal Scout, RK Tracker, Macro Watcher

2. Manual Snapshot Panel

- placeholder/manual price field
- after-hours/manual note field
- high/low/volume placeholder fields
- last reviewed field
- source note

Labels:

- Manual Snapshot
- Not Live Data
- Future Market Data Adapter

3. Chart Placeholder / Future Adapter Area

Create a polished chart-style panel:

- dark background
- candlestick-like placeholder visualization
- moving average labels
- volume bars
- indicator lanes
- timeframe chips

If no real chart library or market data adapter exists, label:

Prototype Chart Surface

Manual Review Only

No Live Feed Connected

4. Timeframe controls:

- 20 min
- Daily
- Weekly
- Monthly
- Quarterly

5. Indicator labels:

- EMA 5
- EMA 8
- EMA 9
- EMA 12
- EMA 252
- Volume
- Volume Imbalance
- KDJ / Momentum

If placeholder only, label:

Indicator Labels / Manual Reference Only

6. Indicator Checklist

- EMA trend
- Volume spike
- After-hours move
- Key level nearby
- Breakout watch

- Pullback watch
- Risk elevated
- News needed
- CEO B review needed

7. Notes Area

- manual observation note
- thesis note
- risk note
- next action note

8. Local Action Buttons

- Add Chart Note to CEO B Review
- Create Signal Task
- Send Snapshot to Archive
- Add to RK Tracker
- Mark Needs Research

All buttons use shared localStorage/local queue only.

No backend.

No trade execution.

=====

9. AUTO-UPDATING AI HANDOFF

=====

Make sure /ai-handoff is reliable and auto-updating.

/ai-handoff must return plain text or markdown-style text, not the normal HTML fallback.

It should include current context from:

- AGENTS.md
- PROJECT_STATUS.md
- NEXT_STEPS.md if present
- key project status from habitat-data.js if practical

If NEXT_STEPS.md does not exist, create it.

The handoff should include:

- Project name: Pickaxe Capital / AI Habitat OS
- Main local URL: <http://localhost:4328/vision-map>
- Handoff URL: <http://localhost:4328/ai-handoff>
- Project update URL: <http://localhost:4328/project-update>
- Architecture truth: static Node app, server.mjs serves public/
- Active files
- Main routes
- Build/check commands
- Current status summary from PROJECT_STATUS.md
- Project rules summary from AGENTS.md
- Next steps from NEXT_STEPS.md or PROJECT_STATUS.md
- Honest labels
- urgent market watchlist
- Market Chart Workspace summary
- Agent Builder Factory summary
- Quantum Brain summary
- Future Voice Command Layer summary
- Apple Command Ecosystem summary

- GitHub repo target: <https://github.com/Burberry/pickaxe-capital-command-center>
- Deployment/public preview note
- Warning that localhost links only work on B's Mac
- Warnings: no scraping, no auto-trading, no fake live agents, no API keys in frontend

Content type:

text/plain; charset=utf-8

or

text/markdown; charset=utf-8

Do not expose:

- secrets
- env vars
- API keys
- node_modules
- hidden files
- arbitrary user-supplied paths

Add or improve UI section on /staging or existing handoff panel:

Title:

Copy Current Website Context

Text:

Use this local handoff when you want ChatGPT, Codex, or another AI to understand the current Pickaxe Capital website state. Copying the full text is the most reliable option because localhost links only open on this Mac.

Show:

Local auto-updating context

<http://localhost:4328/ai-handoff>

Buttons:

- Copy Handoff Text
- Copy Link
- Open

Button behavior:

- Copy Handoff Text fetches /ai-handoff and copies returned text to clipboard.
- Copy Link copies <http://localhost:4328/ai-handoff>.
- Open opens /ai-handoff.

Helper note:

Auto-updates from AGENTS.md, PROJECT_STATUS.md, and NEXT_STEPS.md.

=====

10. ADD CHATGPT-READABLE PROJECT UPDATE PAGE

=====

Create required route:

/project-update

Purpose:

A polished human-readable status page that ChatGPT, Gemini, Claude, Grok, Perplexity, or Codex can read after the site is deployed publicly.

Important:

ChatGPT cannot access localhost links unless B manually copies/pastes text.

This page must be public-preview-ready for GitHub Pages, Vercel, Netlify, or another static host.

Difference:

- /ai-handoff = plain text / markdown AI handoff
- /project-update = polished human-readable project status website page

/project-update should include:

1. Project Overview

- Project name: Pickaxe Capital / AI Habitat OS
- Purpose: premium founder command center, AI Habitat OS, agent civilization, archive intelligence vault, mission board, source hub, CEO B decision layer
- Architecture truth: static Node app, server.mjs serves public/
- Current design direction: luxury cyberpunk command center

2. Current URLs

Show:

- Local website: <http://localhost:4328>
- Local AI handoff: <http://localhost:4328/ai-handoff>
- Local project update: <http://localhost:4328/project-update>
- Future deployed website: placeholder
- Future GitHub repo: <https://github.com/Burberry/pickaxe-capital-command-center>

3. Active Routes

List route status for all active routes, including:

/

/vision-map

/agents

/agent-builder-factory

/archive

/staging

/founder

/ceo-b-profile

/jarvis-lab

/life-os

/signals

/source-hub

/rk-tracker

/bookmarks

/berkshire-1965

/app/alerts

/market-command

/signal-engine

/life-habitat

/ai-handoff

/project-update

Each route should show:

- status
- owner agent
- purpose
- next task
- priority
- link

4. Build Status

Show:

- last build result
- last check:project result
- route verification result
- last updated timestamp if available

- known issues
- next recommended task

Use honest labels:

- Verified
- Needs Review
- Prototype
- Static
- Future Adapter
- Research
- Not Implemented

5. How ChatGPT Should Use This Page

Text:

When B shares this page with ChatGPT, use it to understand the current Pickaxe Capital / AI Habitat OS project state. Review the active routes, current issues, project rules, market focus, Quantum Brain workflow, voice roadmap, Apple ecosystem, and next steps. Suggest improvements that preserve the existing design, avoid fake live claims, and keep the static Node architecture stable.

6. Copy Buttons

- Copy AI Handoff
- Copy Project Update Summary
- Copy GitHub Repo Link
- Open AI Handoff
- Open Staging Mission Board

7. Deployment Readiness

Explain:

- Localhost only works on B's Mac.

- For ChatGPT to open the website directly, deploy the static site to a public URL.

- Recommended path:

1. Push project to private GitHub repo.
2. Deploy preview using Vercel, Netlify, GitHub Pages, or another static host.
3. Share the deployed /project-update or /ai-handoff URL with ChatGPT.
4. Keep PROJECT_STATUS.md and NEXT_STEPS.md updated every session.

8. Current Market Focus

Include B's urgent watchlist only:

BTC, SPY, QQQ, TSLA, AAPL, AMD, NVDA, MSFT, AMZN, UVXY, SPX, MESmain, GCmain, SImain, SICmain, CLmain, DXY.

State:

Do not expand market universe until B approves more symbols.

9. Market Chart Workflow

Explain QQQ default chart workspace, manual snapshot labels, no live feed, no trading execution, and CEO B Review first.

10. Quantum Brain Workflow

Explain the multi-AI manual workflow.

11. Future Voice Command Layer

Explain iPhone voice workflow as Future Adapter / Research only.

12. Apple Command Ecosystem

Explain iPhone, Mac mini, Mac Neo, and iPad Air roles.

13. Agent Builder Factory

Explain /agent-builder-factory route and localStorage-only customization.

=====

11. UPGRADE /STAGING INTO MISSION BOARD

=====

Do not create a duplicate todo page.

Use /staging as the master To-Do / Mission Board.

Title:

Pickaxe Capital Mission Board

Subtitle:

CEO B's build tracker for routes, agents, archive, signals, integrations, future adapters, and Codex recovery work.

Sections:

1. Now
2. Next
3. In Progress
4. Blocked
5. Completed
6. Future Adapter / Research

Include planned tasks:

- Preserve current AI Habitat OS command-center design
- Finish honesty cleanup from AGENTS.md
- Remove/correct fake game metrics
- Fix fake system telemetry
- Correct agent status labels
- Make command-center animations functional
- Focus Market Habitat on urgent watchlist only
- Add Market Chart Workspace
- Add /agent-builder-factory

- Connect /vision-map actions to CEO B Review Stack
- Connect /archive card actions to local mission queue
- Keep /ai-handoff auto-updating
- Keep /project-update current and useful for ChatGPT review
- Improve /signals readability
- Improve /rk-tracker readability
- Improve /archive as intelligence vault
- Improve /bookmarks import workflow
- Add safer future X OAuth/API plan
- Add Hermes Agent as Future Adapter / Research only
- Add Quantum Brain review workflow
- Add Future Voice Command Layer
- Add Apple Command Ecosystem
- Verify all routes
- Update PROJECT_STATUS.md every session
- Organize repo and avoid unrelated Docker/Python project confusion

Add Route Status Board:

- /vision-map
- /agents
- /agent-builder-factory
- /signals
- /archive
- /source-hub
- /rk-tracker

- /berkshire-1965
- /bookmarks
- /app/alerts
- /founder
- /staging
- /jarvis-lab
- /life-os
- /ceo-b-profile
- /market-command
- /signal-engine
- /life-habitat
- /ai-handoff
- /project-update

Each route should show:

- status
- owner agent
- next task
- priority
- link

Add Integration Roadmap:

- X Bookmarks OAuth/API -> Future Adapter
- Hermes Agent -> Future Adapter / Research
- Market data adapter -> Future Adapter
- TradingView widget/fallback -> Prototype/Future Adapter

- Archive local actions -> Prototype
- Jarvis Lab command console -> Prototype
- Voice/camera/device control -> Future Adapter only
- Public deployment preview -> Future Adapter / Setup
- GitHub repo backup -> Setup
- Quantum Brain council -> Manual Workflow Now / Future Adapter Later
- Apple Shortcuts/Siri -> Future Adapter / Research
- No auto-trading

Add card:

ChatGPT Review Link

Text:

Use /project-update when you want ChatGPT to review the current website state from a deployed URL. Use /ai-handoff when you want a plain-text project handoff.

Buttons:

- Open Project Update
- Copy Project Update Link
- Open AI Handoff
- Copy AI Handoff Text

Use existing buildCompletionTracker if present.

Do not create duplicate trackers.

Preserve localStorage.pickaxeCompletionTracker if already used.

=====

12. HERMES AGENT ROADMAP ONLY

=====

Add Hermes Agent only as Future Adapter / Research.

Do not install Hermes.

Do not copy Hermes source code.

Do not wire it into the active website yet.

Do not claim Hermes is running.

Do not claim agents are autonomous.

Add Hermes to:

- source/integration registry in habitat-data.js
- /source-hub or /jarvis-lab if those pages support integration cards
- /staging Integration Roadmap
- /project-update
- /ai-handoff

Hermes card:

- name: Hermes Agent
- provider: Nous Research
- status: Future Adapter / Research
- purpose: possible future backend worker/operator layer
- possible uses:
 - scheduled reports
 - archive summarization
 - bookmark processing
 - source monitoring
 - CEO B briefing generation
 - local mission queue execution
 - subagent task delegation

- current state:

Not installed. Not connected. Research only.

Warnings:

- No live automation
- No API keys in frontend
- No auto-trading
- No scraping
- All automated outputs must go to CEO B Review first

=====

13. MULTI-AI "QUANTUM BRAIN" REVIEW SYSTEM

=====

I want ChatGPT, Gemini, Claude, Grok, and Perplexity to work together like one "Quantum Brain" for me, but keep it honest, safe, and realistic.

Important:

Do NOT claim these AIs are actually connected unless real APIs are added later.

Do NOT add API keys.

Do NOT add backend orchestration.

Do NOT fake autonomous AI collaboration.

Do NOT scrape AI websites.

Do NOT automate login sessions.

Do NOT send private project data to external AI services automatically.

Build this as a local workflow and future adapter system.

Add this concept across:

- /project-update
- /staging

- /source-hub
- /jarvis-lab if appropriate
- /agents if appropriate
- /ai-handoff
- README.md
- NEXT_STEPS.md
- PROJECT_STATUS.md
- habitat-data.js if route/status/integration data is centralized

Section title:

Quantum Brain Council

Purpose:

A multi-AI review workflow where each AI has a different job, and all outputs flow back to CEO B for final decision.

Council members:

1. ChatGPT

Role:

- project architect
- Codex prompt builder
- implementation planner
- UI/UX improvement reviewer
- consistency checker
- handoff writer

2. Claude

Role:

- long-context reasoning

- document review
- writing cleanup
- product logic review
- safety and clarity review

3. Gemini

Role:

- Google ecosystem helper
- research comparison
- document/spreadsheet workflow planning
- multimodal review when useful

4. Grok

Role:

- X/Twitter awareness
- culture/news pulse
- market sentiment research idea generator
- social/web trend reviewer

5. Perplexity

Role:

- source-backed research
- citation gathering
- market/news/source discovery
- fact-checking and references

Final decision layer:

CEO B

CEO B role:

- reviews all AI outputs
- approves/rejects actions
- decides what enters the website, archive, staging board, or Codex prompt
- no AI output becomes final without CEO B approval

Preferred:

Add Quantum Brain sections to:

- /project-update
- /staging
- /source-hub
- /jarvis-lab

Optional route only if clean and simple:

/quantum-brain

If /quantum-brain is added, also add it to:

- navigation
- route status board
- /ai-handoff
- /project-update
- README.md
- PROJECT_STATUS.md
- NEXT_STEPS.md

Quantum Brain UI:

1. Council Cards

Each AI gets:

- name
- role
- best use
- current status
- future adapter status
- copy prompt button if possible

2. Workflow Board

B's Goal

- ChatGPT: architecture + Codex plan
- Claude: long-context cleanup + logic review
- Gemini: Google/workflow/multimodal review
- Grok: X/news/sentiment angle
- Perplexity: source-backed research
- CEO B Review Stack
- Approved Mission
- Codex / Website / Archive / Staging

3. Prompt Templates

Add copyable prompt templates:

ChatGPT Prompt:

"You are my Pickaxe Capital project architect. Review this project-update/handoff and produce the cleanest next Codex plan. Preserve the current design, avoid fake live claims, and keep the static Node architecture stable."

Claude Prompt:

"Review this Pickaxe Capital project handoff for clarity, contradictions, duplicate ideas, and overcomplication. Rewrite the plan into a clean product strategy without adding fake functionality."

Gemini Prompt:

“Review this Pickaxe Capital / AI Habitat OS project from a productivity, Google ecosystem, and multimodal workflow perspective. Suggest practical ways to organize files, screenshots, bookmarks, and next actions.”

Grok Prompt:

“Review this Pickaxe Capital project from an X/Twitter, news, trend, and sentiment-monitoring perspective. Suggest useful signal categories, but do not recommend scraping or fake live automation.”

Perplexity Prompt:

“Research the public sources relevant to this Pickaxe Capital project idea. Return source-backed findings, links, risks, and practical next steps. Separate facts from speculation.”

CEO B Synthesis Prompt:

“Combine the outputs from ChatGPT, Claude, Gemini, Grok, and Perplexity into one CEO B decision brief. Remove duplicates, flag contradictions, rank priorities, and produce the next Codex-ready action plan.”

4. Local Action Buttons

- Copy ChatGPT Prompt
- Copy Claude Prompt
- Copy Gemini Prompt
- Copy Grok Prompt
- Copy Perplexity Prompt
- Copy CEO B Synthesis Prompt
- Add Quantum Brain Review to CEO B Stack
- Create Mission from Quantum Brain Review

All local/localStorage only.

No backend calls.

No external API calls.

No fake execution.

Honest labels:

- Manual Workflow Now
- Future Adapter Later
- Not Connected
- No API Key
- CEO B Approval Required
- Local Copy/Paste Workflow

Do not use:

- Online
- Running
- Autonomous
- Connected
- Live AI Swarm
- Auto-executing

=====

14. FUTURE VOICE COMMAND LAYER: IPHONE + CHATGPT + CODEX

=====

I want the future version of Pickaxe Capital / AI Habitat OS to let me use my iPhone 17 Pro Max to speak with ChatGPT/Codex and run my website by voice.

Important:

Do NOT claim this is working now unless actually implemented and tested.

Do NOT add fake voice control.

Do NOT add microphone permissions unless the feature is explicitly implemented safely.

Do NOT add API keys to the frontend.

Do NOT add voice/camera/device control now.

Do NOT create unsafe autonomous execution.

Do NOT let voice commands directly trade, delete data, send messages, or make irreversible changes.

Build as Future Adapter / Research roadmap for now.

Current state:

- Manual workflow only.
- B can speak to ChatGPT on phone and paste/copy outputs manually.
- Website can show a future voice command roadmap.
- No real voice backend connected yet.
- No Codex execution from voice yet.
- No autonomous website control yet.

Future goal:

B should eventually be able to speak into iPhone and say:

- "ChatGPT, review my Pickaxe Capital project update."
- "Create a Codex prompt to improve the Market Habitat."
- "Add this idea to CEO B Review."
- "Summarize today's market watchlist."
- "Create a task in the Mission Board."
- "Open the project update page."
- "Prepare the next Codex build plan."
- "Read my urgent watchlist."
- "Send this to Quantum Brain review."
- "Show me what needs to be fixed next."

Add across:

- /project-update

- /staging
- /source-hub
- /jarvis-lab if appropriate
- /ai-handoff
- README.md
- NEXT_STEPS.md
- PROJECT_STATUS.md

Section:

Future Voice Command Layer

Purpose:

A planned iPhone + ChatGPT + Codex voice workflow where B can speak goals, convert them into approved tasks, and route them into CEO B Review before any code or website action happens.

Status:

Future Adapter / Research

Current mode:

Manual voice-to-ChatGPT workflow only.

Future architecture:

iPhone voice input

→ ChatGPT conversation

→ CEO B Review

→ approved mission

→ Codex prompt

→ GitHub commit / website update

→ /project-update and /ai-handoff refresh

Warning:

Voice commands are not connected to the website yet. No automatic execution. CEO B approval required.

Voice command safety levels:

Level 0 — Manual:

B speaks to ChatGPT on iPhone, then manually copies the output into Codex or the website.

Level 1 — Local Draft:

Voice command creates a local draft task in CEO B Review only.

Level 2 — Confirmed Action:

Voice command can update localStorage tasks only after confirmation.

Level 3 — GitHub/Codex Handoff:

Voice command creates a Codex-ready prompt, but B must manually approve before Codex runs.

Level 4 — Backend Automation:

Future only. Requires secure backend, authentication, logs, permissions, and rollback.

Level 5 — Restricted:

Never allow direct trading execution, secret exposure, destructive actions, or unapproved external posting.

Voice prompt templates:

1. Project Review

“ChatGPT, open my Pickaxe Capital project-update summary and tell me the next best task.”

2. Codex Prompt

“ChatGPT, turn this project status into one clean Codex prompt. Preserve the current design and do not add fake live systems.”

3. Market Watchlist

“ChatGPT, review only my urgent watchlist: BTC, SPY, QQQ, TSLA, AAPL, AMD, NVDA, MSFT, AMZN, UVXY, SPX, MESmain, GCmain, SImain, SICmain, CLmain, and DXY.”

4. Quantum Brain

“ChatGPT, prepare a Quantum Brain review brief for Claude, Gemini, Grok, and Perplexity, then synthesize the outputs into CEO B Review.”

5. Mission Board

“ChatGPT, create a Mission Board task from this idea and rank it by priority, risk, and next action.”

6. Website Fix

“ChatGPT, inspect this issue and write a safe Codex prompt that fixes it without redesigning the whole website.”

7. Daily CEO B Briefing

“ChatGPT, summarize what changed, what is broken, what matters today, and what I should do next.”

Apple Shortcuts / Siri:

Future Adapter / Research only.

Do not claim Siri/Shortcuts is connected now.

Do not create unsafe automations.

Do not require iPhone-specific code in the static site.

=====

15. APPLE COMMAND ECOSYSTEM: IPHONE + MAC MINI + MAC NEO + IPAD AIR

=====

I want my devices to work together as one Pickaxe Capital command ecosystem.

Devices:

- iPhone 17 Pro Max
- Mac mini
- MacBook “Mac Neo”
- iPad Air

Goal:

Give every device a clear purpose in the Pickaxe Capital / AI Habitat OS workflow and create a realistic ecosystem plan that connects them without fake claims.

Do NOT:

- claim devices are connected to the website unless actually implemented and tested
- add unsafe remote-control features
- expose API keys or secrets
- create automatic trading, posting, deleting, or code execution
- build native iOS/macOS apps now
- add device-control code to the frontend
- pretend the website can control Apple devices

Build as:

- workflow plan
- Future Adapter / Research roadmap
- local command ecosystem section
- mission board checklist
- AI handoff context

Device roles:

1. iPhone 17 Pro Max

Role:

Mobile CEO B command device.

Uses:

- speak ideas to ChatGPT
- capture urgent thoughts
- review /project-update after deployment

- trigger manual Quantum Brain review prompts
- check urgent market watchlist
- approve or reject tasks
- capture screenshots and notes
- mobile CEO B briefing

Status:

Manual Now / Future Adapter

2. Mac mini

Role:

Main Pickaxe Capital command server and build station.

Uses:

- run local website at <http://localhost:4328>
- run server.mjs
- run Codex sessions
- store working project folder
- run build/check commands
- maintain GitHub repo
- host local /ai-handoff and /project-update

Status:

Primary Workstation / Local Server

Rule:

Mac mini is source of truth for local development until GitHub deployment is active.

3. MacBook “Mac Neo”

Role:

Mobile development and review station.

Uses:

- review GitHub repo
- open deployed preview
- test website away from desk
- write Codex prompts
- inspect project status
- compare designs
- work while traveling
- emergency backup development machine

Status:

Secondary Workstation / Review Station

Rule:

Mac Neo should pull from GitHub, not become a separate messy copy.

4. iPad Air

Role:

Visual dashboard, mission board, and second-screen review device.

Uses:

- keep /staging Mission Board open
- keep /project-update open
- review visual design
- display urgent watchlist
- display Quantum Brain workflow
- review CEO B tasks

- planning canvas
- second-screen companion while Mac mini/Codex works

Status:

Dashboard / Review Companion

Daily Apple Command Flow:

Morning:

1. iPhone:

- speak CEO B briefing request to ChatGPT
- capture urgent ideas
- check urgent watchlist manually

2. Mac mini:

- open local website
- run /project-update
- run /staging
- run Codex if needed
- update PROJECT_STATUS.md and NEXT_STEPS.md

3. iPad Air:

- keep Mission Board or Project Update open as visual dashboard
- review Codex changes
- check design readability

4. Mac Neo:

- review GitHub/deployed preview
- test site outside Mac mini environment
- prepare backup prompts or notes

Evening:

1. Mac mini:

- run build/check
- update /ai-handoff
- update /project-update
- commit to GitHub

2. iPhone:

- ask ChatGPT for next best task
- save voice notes or urgent ideas

3. iPad Air:

- review Mission Board before stopping

Add Apple Command Ecosystem to:

- /project-update
- /ai-handoff
- /staging
- /source-hub or /jarvis-lab
- README.md
- NEXT_STEPS.md

=====

16. AGENT BUILDER FACTORY: CUSTOM VOXEL AI AGENTS

=====

Create a new page/route:

/agent-builder-factory

Purpose:

A customization factory where B can design, organize, and manage the Minecraft-style / voxel AI agent characters used across Pickaxe Capital / AI Habitat OS.

This page should feel like:

- voxel character creator
- AI agent factory
- command-center customization lab
- premium cyberpunk workshop
- agent civilization management system

Use the uploaded Minecraft-style character lineup image as visual direction reference only.

Do not copy official Minecraft branding.

Do not use official Minecraft UI.

Use terms like:

- voxel agent
- block-style character
- agent avatar
- character factory
- Pickaxe agent

Do NOT:

- create real autonomous agents
- claim agents are live unless actually implemented
- add fake backend execution
- add fake AI training
- add paid APIs
- add 3D engines unless already present
- install heavy dependencies

- break existing pages
- redesign whole site

Route:

/agent-builder-factory

Page title:

Agent Builder Factory

Subtitle:

Customize Pickaxe Capital's voxel AI agents, assign roles, habitats, tools, styles, and CEO B review rules.

Add navigation link:

- Sidebar
- Bottom nav if space allows
- /agents page
- /staging Mission Board
- /project-update
- /ai-handoff route list

If navigation is crowded, add under Agents or Jarvis Lab as:

Agent Builder

Core layout:

1. Factory Header

- Agent Builder Factory
- "Design, assign, and review Pickaxe Capital AI agents."
- status label: Prototype / Local Customization Only
- warning: No autonomous execution. CEO B approval required.

2. Agent Preview Stage

Large center preview area showing selected voxel-style agent.

If real assets are not available, create CSS/block-style placeholder avatars using divs, gradients, emoji, or pixel cards.

Preview should show:

- head
- body
- outfit color
- tool/accessory
- habitat color glow
- role badge
- status badge

3. Customization Controls

Identity:

- Agent name
- Agent title
- Agent number
- Role/class
- Personality style
- CEO B review rule

Visual style:

- Skin tone / avatar base
- Hair/helmet
- Outfit color
- Armor/accent color
- Glow color

- Tool/accessory
- Background/factory style

Agent role:

- System Brain
- Signal Scout
- News Raven
- Risk Sentinel
- Macro Watcher
- Flow Hunter
- Map Builder
- Bookmark Miner
- Archive Keeper
- Wealth Alchemist
- Task Smith
- Auto Update Agent
- Story Teller
- Custom Agent

Habitat:

- Market Habitat
- Life / Knowledge Habitat
- Archive Vault
- Source Hub
- Staging / QA Forge
- Trading Floor

- CEO B Command Layer

Status:

- Static
- Prototype
- Research
- Future Adapter
- Live only if actually implemented/testable

Priority:

- Low
- Medium
- High
- Urgent

4. Agent Factory Assignment

Let B assign:

- Owned route
- Owned sources
- Current task
- Next action
- Risk flag
- Review note
- Tool permissions

Tool permissions labels:

- Read-only
- Local UI only

- LocalStorage only
- Future Adapter
- CEO B approval required

5. Saved Agent Roster

Grid of saved custom agents.

Each card:

- avatar preview
- name
- role
- habitat
- status
- current task
- priority
- buttons:
 - Edit
 - Duplicate
 - Send to CEO B Review
 - Create Mission
 - Reset

Use localStorage only.

6. Factory Templates

Preset templates:

- Market Scout
- Archive Miner

- Risk Sentinel
- News Raven
- Task Builder
- Source Connector
- CEO B Reviewer
- Quantum Brain Coordinator
- Voice Command Assistant
- Apple Ecosystem Coordinator

Each template prefills:

- role
- habitat
- status
- suggested colors
- current task
- next action
- review rule

Preferred localStorage key:

localStorage.pickaxeAgentFactory

Each custom agent:

- id
- name
- title
- role
- classType

- habitat
- status
- priority
- avatarConfig
- baseColor
- hairStyle
- outfitColor
- accentColor
- glowColor
- tool
- background
- ownedRoute
- ownedSources
- currentTask
- nextAction
- riskFlag
- ceoReviewNote
- permissions
- createdAt
- updatedAt

If possible:

- load existing agents from habitat-data.js as defaults
- save custom overrides to localStorage.pickaxeAgentFactory
- keep original canonical agent data safe

Connect to same CEO B Review Stack / mission queue.

Buttons:

1. Send to CEO B Review

Creates review item:

Title:

Agent customization review: [Agent Name]

Type:

Agent Builder Factory

Status:

CEO B Review Required

2. Create Mission

Creates mission:

Title:

Build or improve [Agent Name]

Owner:

Task Smith / System Brain

3. Save Agent

Saves to localStorage.pickaxeAgentFactory

4. Reset Factory

Clears only factory draft state, not all website data.

Update /agents page:

Add link/card:

Agent Builder Factory

Text:

Customize voxel-style Pickaxe agents, assign roles, habitats, tasks, and CEO B review rules.

Buttons:

- Open Agent Builder Factory
- Create New Agent
- Review Saved Agents

If saved custom agents exist, show:

Custom Agents Saved: X

Design:

- dark cyberpunk factory background
- glowing workbench
- pixel/voxel card design
- blocky character preview
- neon outlines
- habitat-colored accents
- clean readable controls
- no clutter
- responsive layout

Suggested layout:

- desktop: three-column factory
- tablet: two-column
- mobile: stacked sections

Add local factory log:

Examples:

- "System Brain prototype outfit saved locally."

- "Signal Scout sent to CEO B Review."
- "Task Smith created mission from custom agent."
- "Archive Keeper template duplicated."

Label:

Local Factory Log / Prototype Only

=====

17. ARCHIVE LOCAL ACTIONS

=====

Make /archive cards support local prototype actions:

- Summarize
- Turn Into Checklist
- Extract Opportunity
- Send To Agent
- Send to CEO B Review

These write to same shared local queue.

No backend.

No fake AI summarization unless actual logic exists.

If summarization is placeholder, label:

Prototype Action / Manual Review Required

=====

18. VISION MAP LOCAL ACTIONS

=====

Make /vision-map node actions write to same CEO B Review Stack / local mission queue used by /agents and /staging.

Do not create second queue.

User flow:

- click a node
- add to CEO B Review
- go to /agents or /staging
- see item in CEO B Review Stack or mission queue

If already done, verify and report.

If not possible, defer honestly with exact reason.

=====

19. SOURCE HUB / JARVIS LAB INTEGRATION CARDS

=====

Add or update integration/workflow cards where appropriate:

- Hermes Agent
- ChatGPT
- Claude
- Gemini
- Grok
- Perplexity
- Market Data / Chart Adapter
- ChatGPT Mobile Voice
- Apple Shortcuts / Siri
- Codex Voice Handoff
- iPhone CEO B Voice Console
- Mac mini Command Server
- Mac Neo Review Station

- iPad Air Mission Dashboard

Each card should include:

- official/tool name
- role/purpose
- status
- current state
- future adapter note
- warning if not connected

Use honest statuses:

- Manual Now
- Primary Local Hub
- Dashboard Companion
- Future Adapter / Research
- Not Connected
- No API Key
- CEO B Approval Required

=====

20. README / GITHUB / DEPLOYMENT READINESS

=====

Prepare the project for a private GitHub repository named:

pickaxe-capital-command-center

Tasks:

1. Check project for files that should not be committed:

- secrets

- .env files
- API keys
- node_modules
- build folders
- hidden local machine files
- private local-only files
- unrelated Docker/FastAPI/adcheck/graduation project files unless intentionally part of this repo

2. Create or update .gitignore with safe defaults:

node_modules

dist

build

.next

.astro

.vercel

.env

.env.*

.DS_Store

npm-debug.log*

yarn-debug.log*

yarn-error.log*

pnpm-debug.log*

__pycache__

*.pyc

.venv

venv

.idea

.vscode

docker-compose.override.yml

3. Create or update README.md.

README must clearly explain:

Pickaxe Capital Command Center

Include:

- project purpose
- architecture truth: static Node app, server.mjs serves public/
- active files
- core routes
- /project-update as the human-readable project status page
- /ai-handoff as the AI-readable project handoff page
- /agent-builder-factory as prototype voxel agent customization page
- ChatGPT cannot access localhost unless the user copies text or deploys the site publicly
- local development steps
- build/check commands
- current status
- known limitations
- urgent watchlist
- Market Chart Workspace
- Quantum Brain workflow
- Future Voice Command Layer

- Apple Command Ecosystem
- GitHub as source of truth
- safety note: no real trading execution, no fake live AI claims, no private secret exposure
- repo organization note: do not mix unrelated Docker/FastAPI projects into this static Node app
- GitHub repo target:

<https://github.com/Burberry/pickaxe-capital-command-center>

4. Create or update GITHUB_UPLOAD.md with exact instructions.

Include:

```
git init
```

```
git add .
```

```
git commit -m "Initial Pickaxe Capital command center backup"
```

```
git branch -M main
```

```
git remote add origin https://github.com/Burberry/pickaxe-capital-command-center.git
```

```
git push -u origin main
```

Also include:

If GitHub says the remote already exists, run:

```
git remote set-url origin https://github.com/Burberry/pickaxe-capital-command-center.git
```

Deployment note:

For ChatGPT to open the project directly:

- push to GitHub
- deploy static site to GitHub Pages, Vercel, Netlify, or another static host
- share deployed /project-update link with ChatGPT
- share /ai-handoff for plain-text AI context

Apple ecosystem setup checklist:

1. Push project to GitHub.
2. Deploy a preview URL.
3. Bookmark these on iPhone, Mac Neo, and iPad:
 - deployed homepage
 - deployed /project-update
 - deployed /ai-handoff
 - deployed /staging
4. Keep Mac mini as main local development hub.
5. Use GitHub to sync Mac mini and Mac Neo.
6. Use iPad Air as Mission Board display during Codex sessions.
7. Use iPhone voice with ChatGPT for ideas and CEO B review.
8. Do not run separate unsynced project copies.
9. Do not expose secrets or API keys.
10. Do not enable automation without approval/logs/rollback.

=====

21. PROJECT STATUS UPDATES

=====

Before stopping, update:

- PROJECT_STATUS.md
- NEXT_STEPS.md
- AGENTS.md only if a small rule correction is truly needed
- README.md
- GITHUB_UPLOAD.md
- public/habitat-data.js buildCompletionTracker if it exists

PROJECT_STATUS.md must include:

- unfinished work resumed
- architecture verified
- unrelated Docker/Python screenshot handled as caution only
- command-center animation/interactions added
- shared local review/task system connected or deferred
- urgent watchlist added
- Market Chart Workspace added
- /ai-handoff improved
- /project-update added
- /staging upgraded into Mission Board if completed
- Hermes added as Future Adapter / Research if completed
- Quantum Brain workflow added
- Future Voice Command Layer added
- Apple Command Ecosystem added
- /agent-builder-factory added
- files changed
- build result
- check:project result
- route check result
- visual QA result
- remaining verified issues
- next recommended task

NEXT_STEPS.md must include current next tasks only.

Create NEXT_STEPS.md if missing.

=====

22. VISUAL QA AND READABILITY

=====

Do a visual QA pass only.

Do not redesign.

Check:

- readable at 100% zoom
- no horizontal overflow at 1440px
- cards aligned and balanced
- text not too tiny
- right rail readable
- bottom panels not cramped
- no random light/cream panels
- no duplicate sections
- no fake-live wording
- Agent Builder Factory responsive layout works
- Market Chart Workspace readable
- /project-update readable
- /staging mission board not cramped

Routes to visually inspect:

- /
- /vision-map
- /agents

- /agent-builder-factory
- /archive
- /staging
- /signals
- /source-hub
- /rk-tracker
- /bookmarks
- /jarvis-lab
- /market-command
- /signal-engine
- /project-update

=====

23. VALIDATION

=====

Run:

```
/Applications/Codex.app/Contents/Resources/node --run build
```

Then run:

```
/Applications/Codex.app/Contents/Resources/node --run check:project
```

Verify these routes return 200:

/

/vision-map

/agents

/agent-builder-factory

/archive

/staging

/founder

/ceo-b-profile

/jarvis-lab

/life-os

/signals

/source-hub

/rk-tracker

/bookmarks

/berkshire-1965

/app/alerts

/market-command

/signal-engine

/life-habitat

/ai-handoff

/project-update

Check:

- browser console errors on changed routes
- horizontal overflow at 1440px
- /ai-handoff returns text, not HTML fallback
- /project-update returns polished HTML page, not fallback
- /agent-builder-factory loads and saves localStorage
- local actions update shared review/task queue
- Copy Handoff Text works if browser permissions allow clipboard

- Copy Link works
- Open handoff works
- Project Update copy buttons work
- Agent Builder save/edit/duplicate/review buttons work locally
- Market Chart Workspace actions write to CEO B Review
- prefers-reduced-motion works
- no unrelated Docker/Python services are required for this app
- no broken import assumptions remain in the active app

Do not mark validation passed unless commands actually pass.

If a command cannot run, report the exact reason and the closest completed validation.

=====

24. REQUIRED FINAL REPORT FORMAT

=====

End with this exact report format:

1. Resume summary:

- what was unfinished from the previous session
- what was continued

2. Architecture / organization check:

- confirmed architecture
- unrelated Docker/FastAPI/adcheck screenshot handled as caution: yes/no
- unrelated files found: yes/no/list
- broken imports found in active app: yes/no/list

3. Visual preservation:

- confirm current AI Habitat OS design was preserved

4. Files changed:

- exact list with one-line description

5. Cleanup/honesty fixes:

- gamification removed/corrected
- fake metrics removed/corrected
- status labels corrected
- fake quick actions corrected
- route health corrected

6. Animation/interactions:

- data-flow animations
- agent hover states
- agent detail drawer
- local action buttons
- operations feed updates
- command terminal feedback
- reduced-motion support

7. Shared local action system:

- shared CEO B Review Stack: done / partial / deferred
- shared Mission Queue: done / partial / deferred
- localStorage keys used
- duplicate queues removed/avoided

8. Local action connections:

- /agents actions to CEO B Review Stack: done / partial / deferred
- /vision-map actions to CEO B Review Stack: done / partial / deferred

- /archive local actions: done / partial / deferred

- /staging local actions: done / partial / deferred

9. Urgent market watchlist:

- canonical watchlist added: yes/no

- only B's selected symbols used: yes/no

- random tickers removed: yes/no

- fake live prices avoided: yes/no

- Market Habitat updated: yes/no

- Signal Scout updated: yes/no

- RK Tracker updated: yes/no

- /staging high-priority task added: yes/no

- /project-update market focus added: yes/no

- /ai-handoff urgent market focus added: yes/no

10. Market Chart Workspace:

- QQQ default chart workspace added: yes/no

- urgent watchlist connected: yes/no

- manual snapshot labels added: yes/no

- chart surface added: yes/no

- timeframe chips added: yes/no

- indicator checklist added: yes/no

- local actions connected to CEO B Review: done / partial / deferred

- no fake live data confirmed: yes/no

- no trading execution confirmed: yes/no

11. /ai-handoff:

- content type
- files included
- Copy Handoff Text status
- Copy Link status
- Open status

12. /project-update:

- route added: yes/no
- human-readable status page: yes/no
- ChatGPT review instructions included: yes/no
- copy buttons included: yes/no
- deployment note included: yes/no
- localhost limitation explained: yes/no

13. /staging Mission Board:

- done / partial / deferred
- ChatGPT Review Link card added: yes/no
- route status board added: yes/no
- integration roadmap added: yes/no

14. Hermes Agent roadmap:

- added as Future Adapter / Research: yes/no
- not installed/not connected confirmed

15. Quantum Brain system:

- ChatGPT role added: yes/no
- Claude role added: yes/no
- Gemini role added: yes/no

- Grok role added: yes/no
- Perplexity role added: yes/no
- CEO B synthesis workflow added: yes/no
- copyable prompts added: yes/no
- local CEO B Review integration: done / partial / deferred
- honest manual workflow labels added: yes/no
- no external AI APIs connected confirmed: yes/no

16. Future voice command layer:

- iPhone voice workflow added: yes/no
- ChatGPT mobile voice plan added: yes/no
- Apple Shortcuts/Siri future adapter added: yes/no
- voice command safety levels added: yes/no
- copyable voice prompt templates added: yes/no
- /project-update voice section added: yes/no
- /ai-handoff voice section added: yes/no
- /staging voice task added: yes/no
- no fake voice control claims confirmed: yes/no
- no direct execution/trading confirmed: yes/no

17. Apple Command Ecosystem:

- iPhone role added: yes/no
- Mac mini role added: yes/no
- Mac Neo role added: yes/no
- iPad Air role added: yes/no
- Apple Command Ecosystem added to /project-update: yes/no

- Apple Command Ecosystem added to /ai-handoff: yes/no
- Apple ecosystem card added to /staging: yes/no
- source/jarvis workflow cards added: yes/no
- README updated with device workflow: yes/no
- GitHub as source of truth confirmed: yes/no
- no fake device-control claims confirmed: yes/no

18. Agent Builder Factory:

- /agent-builder-factory route added: yes/no
- voxel-style preview added: yes/no
- customization controls added: yes/no
- preset templates added: yes/no
- saved roster/localStorage added: yes/no
- connected to CEO B Review Stack: done / partial / deferred
- connected to shared mission queue: done / partial / deferred
- /agents link added: yes/no
- /staging task added: yes/no
- /project-update section added: yes/no
- /ai-handoff section added: yes/no
- no fake autonomous agent claims confirmed: yes/no

19. GitHub readiness:

- .gitignore updated: yes/no
- README.md updated: yes/no
- GITHUB_UPLOAD.md created/updated: yes/no
- secrets check completed: yes/no

- unrelated files protected/reported: yes/no

- repo target: <https://github.com/Burberry/pickaxe-capital-command-center>

20. Commands run:

- exact commands and outputs

21. Build result:

- pass/fail

22. check:project result:

- pass/fail

23. Route status:

- working/broken list

24. Browser console errors:

- none / list

25. Overflow check:

- none / list

26. Remaining known issues:

- verified issues only

27. Next recommended task:

- one specific task only

=====

FINAL REMINDER

=====

You are continuing a project that is finally close visually.

Do not restart.

Do not redesign.

Do not add fake live systems.

Do not mix unrelated Docker/FastAPI/adcheck/graduation-project files into Pickaxe Capital.

Preserve the AI Habitat OS command center.

Make it functional with vanilla JS/CSS.

Keep all claims honest.

Validate everything.

Update PROJECT_STATUS.md, NEXT_STEPS.md, README.md, GITHUB_UPLOAD.md, the Completion Tracker, and /ai-handoff before stopping.

URGENT MARKET GOAL:

Focus Market Habitat, Signal Scout, RK Tracker, and market-related pages only on B's selected watchlist:

BTC, SPY, QQQ, TSLA, AAPL, AMD, NVDA, MSFT, AMZN, UVXY, SPX, MESmain, GCmain, SImain, SICmain, CLmain, and DXY.

Do not add random tickers or fake live prices.

MARKET CHART GOAL:

B's market workflow uses a mobile chart style with QQQ/default symbol, indicators, volume, and timeframe controls. Build this as a manual/prototype Market Chart Workspace for the urgent watchlist only. No fake live data, no hardcoded screenshot prices as truth, and no trading execution.

AGENT BUILDER GOAL:

Add /agent-builder-factory so B can customize voxel/Minecraft-style Pickaxe AI agent characters, assign roles/habitats/tasks/statuses, save them locally, and send changes to CEO B Review. Keep it prototype/localStorage only with no fake autonomous agent claims.

QUANTUM BRAIN GOAL:

ChatGPT, Claude, Gemini, Grok, and Perplexity should be represented as a manual multi-AI review workflow, not a fake connected AI swarm. All outputs go to CEO B Review first.

FUTURE VOICE GOAL:

B wants to eventually speak from iPhone to ChatGPT/Codex and run the Pickaxe Capital workflow by voice, but for now this must be labeled Future Adapter / Research with CEO B approval required and no fake voice-control claims.

APPLE ECOSYSTEM GOAL:

B wants iPhone, Mac mini, Mac Neo, and iPad Air to work together. Mac mini is the main local command server, iPhone is voice/mobile CEO B control, Mac Neo is backup/review workstation, and iPad Air is the mission board/dashboard. Keep this honest as Manual Now / Future Adapter, with GitHub as the source of truth and no fake device-control claims.

GITHUB GOAL:

Prepare this project for private GitHub backup at:

<https://github.com/Burberry/pickaxe-capital-command-center>

PUBLIC REVIEW GOAL:

Add /project-update so ChatGPT can understand the project after deployment. Keep /ai-handoff plain-text and auto-updating.

ORGANIZATION GOAL:

Everything must be clean, organized, working, and ready for Codex/GitHub. If something is not verified, say so. Do not fake completion.
