

PICKAXE CAPITAL

Premium Command-Center Brand Blueprint

Final Product Direction: high-trust, high-status, billionaire-tech energy without cosplay

Prepared from your recovery blueprint, upgraded into a cleaner final-state product vision, stronger website architecture, sharper copy system, and Codex execution package.

Brand	Operating System	Command Layer
Pickaxe Capital	AI Habitat OS	CEO B

1. Executive thesis

The site should feel like the front door of a serious private technology company: precise, sparse, expensive, and controlled. Not sci-fi theater. Not fake autonomy. Not a crowded dashboard. The winning move is to present Pickaxe Capital as a modern command company with an internal operating layer called AI Habitat OS and a decision layer called CEO B.

- Public impression: elite company, not AI gimmick.
- Product logic: one clear hierarchy, one shell, one route system, one language system.
- Emotional target: the confidence of a billion-dollar firm with the restraint of a top-tier investor terminal.
- Truth standard: anything not implemented must be labeled Static, Prototype, Research, or Future Adapter.

2. What “better” should mean

- Less noise. More authority.
- Less fantasy. More believable power.
- Less feature sprawl. More command presence.
- Less duplicate branding. More one-company discipline.
- Less 'AI can do everything'. More 'this company has a system.'

3. Finished product vision

The finished website is a premium command-center company site with three layers:

Layer	Meaning	What the user feels
-------	---------	---------------------

Pickaxe Capital	Company brand and public face	This is an ambitious, disciplined company.
AI Habitat OS	Internal operating system and architecture	There is a real machine behind the brand.
CEO B	Command layer and decision interface	Leadership, direction, and judgment are centralized.

This framing gives you a Stark-like energy without copying Marvel aesthetics or pretending you already ship impossible runtime capabilities. It says: advanced, expensive, controlled, strategic.

4. Homepage product copy

Hero block

- Eyebrow: Pickaxe Capital
- Headline: Capital with a command system.
- Subhead: Pickaxe Capital is the public company layer. AI Habitat OS is the internal operating system. CEO B is the command layer that directs people, systems, research, and execution.
- Primary CTA: Enter the command center
- Secondary CTA: View the system map

Three proof panels

- System architecture — a visible operating structure, not a vague brand story.
- Agent habitat — specialized workers, clearly scoped, honestly labeled.
- Staging and archive — progress, intelligence, sources, and next actions in one place.

Trust strip

- Built for clarity
- Research-backed
- Local-first where possible
- No fake live automation
- Designed for long-horizon execution

5. Route architecture and page intent

Route	Role	Must ship now	Tone
/	Public command-center landing page	Brand hierarchy, quick links, status summary	Confident and immediate
/vision-map	System architecture map	Static visual map of company → OS → command → routes	Elegant and explanatory
/agents	AI worker habitat	Cards with role, scope, status, next action	Operational but honest
/archive	Intelligence vault	Sources, repos, notes, search, tags	Dense and useful

/staging	Progress and QA center	Build status, route status, cleanup log, next steps	Brutally clear
/founder	Founder thesis page	Mission, beliefs, principles, narrative	Editorial and premium
/ceo-b-profile	Command layer profile	Decision model, device roles, operating principles	Strategic and controlled
/jarvis-lab	Optional command lab	Typed commands, local actions only	Prototype
/life-os	Optional device strategy	Phone, iPad, Mac, desktop roles	Future operating model
/device-hub	Optional adapter hub	Integration matrix, status, notes	Future adapter
/vision-lab	Optional experiments	Mockups, system concepts, R&D visuals	Research

6. Visual system: billionaire-tech without cosplay

- Palette: graphite, obsidian, bone, steel, one restrained electric accent.
- Typography: large confident headlines, tight labels, medium body copy, no playful type.
- Panels: sharp card rhythm, subtle depth, soft borders, not heavy glow.
- Motion: minimal. State changes only. No fake terminal spam.
- Layout: persistent left navigation, top status bar, strong page header, optional right context rail on desktop.
- Spacing: wide margins, disciplined grid, generous whitespace.
- Copy style: blunt, strategic, clear. No hype words unless backed by implementation.

Do not imitate the Iron Man UI literally. Do not use circular HUD gimmicks, glowing orange overlays everywhere, or comic-book iconography. Borrow the feeling of wealth, control, and engineering confidence—not the costume.

7. Status language system

Label	Meaning
Live	Implemented and testable now
Static	Informational only
Prototype	Local interface behavior only; no real external execution
Research	Reference or concept
Future Adapter	Planned integration contract; inactive

8. Page-by-page design notes

Home

- Explain the hierarchy in under ten seconds.
- Route cards should look expensive and direct, not playful.
- Keep the first screen uncluttered: one hero, one map summary, one status strip.

Vision Map

- Use a static SVG/CSS architecture diagram.
- The point is clarity, not animation.
- Show flows between company, OS, command layer, agents, archive, staging, labs, and devices.

Agents

- Each agent card should include role, inputs, outputs, tools, status, and next action.
- No fake execution streams.
- Treat the page like a roster of specialized operators.

Archive

- This page should feel like intelligence infrastructure.
- Structured search and tags matter more than flashy cards.
- Repo links, notes, and next actions should live in typed local data if no backend exists.

Staging

- This should become the truth page.
- Surface route status, build status, cleanup list, blockers, and next actions.
- A simple green/yellow/red system is enough.

9. Upgraded master Codex prompt

You are working inside my existing website repository.

This is a recovery-first, premium-finish refactor of an existing project.

You are not building a new app. You are not expanding scope. You are not simulating impossible capabilities.

PRIMARY GOAL

Stabilize, simplify, and finish the current Pickaxe Capital website so it ships as a premium command-center company site with a verified working build.

IDENTITY RULES

- Pickaxe Capital = company / public brand
- AI Habitat OS = internal operating system
- CEO B = command layer / decision brain

NON-NEGOTIABLE RULES

- Inspect the current repository first.
- Detect the real framework, router, source root, build scripts, and active app tree from the repo itself.
- Use the existing framework/router unless the current setup is unrecoverable.
- Fix build blockers first.
- Preserve working routes.
- Simplify broken routes into stable honest pages instead of deleting them.
- Remove duplicates, dead files, shadow components, conflicting route trees, and unused experiments.
- Do not copy code from external repositories.
- Do not invent live voice, live camera, live device control, autonomous agent execution, or trading execution.
- Any non-implemented advanced capability must be labeled Static, Prototype, Research, or Future Adapter.
- Do not stop after planning. Make edits, run verification, and report exact results.

TARGET ROUTES

Core routes:

/

/vision-map

/agents

/archive

/staging

/founder

/ceo-b-profile

Optional routes only if already present and safe:

/jarvis-lab

/life-os

/device-hub

/vision-lab

PRODUCT TARGET

The site should feel like the digital front door of a billion-dollar private technology company:

calm, expensive, precise, strategic, and believable.

Do not make it feel like a sci-fi costume.

Prefer clarity, hierarchy, typography, whitespace, and disciplined panels over gimmicks.

IMPLEMENTATION ORDER

1. Audit the repo and identify the real active app tree, router, scripts, and blockers.
2. Run the current build command and fix all build/import/type errors first.
3. Consolidate layout into one shared shell.
4. Create one canonical source for navigation, route metadata, status labels, and reusable content collections.
5. Recover all core routes so they render cleanly.
6. Simplify optional routes if needed rather than breaking them.
7. Apply the honesty/status labeling system consistently.
8. Upgrade the UI to feel premium, restrained, and readable.
9. Run build again. Run lint/typecheck/tests if scripts already exist.
10. Finish with an exact report: stack detected, files changed, files removed, commands run, route status, final results.

HOMEPAGE REQUIREMENTS

- Explain the hierarchy quickly: Pickaxe Capital -> AI Habitat OS -> CEO B
- Include quick route cards to all core routes
- Include concise current-status panels

- Eliminate duplicate naming and clutter
- Make the first screen feel expensive and under control

DESIGN RULES

- One accent strategy only
- One token system for spacing, colors, radius, shadows, typography
- Strong contrast and accessible landmarks
- Minimal motion
- No fake telemetry
- No random gradients
- No over-blurred glassmorphism
- No duplicate panel/card systems

SUCCESS CRITERIA

The task is done only if:

- the app builds successfully,
- the core routes are coherent,
- duplicates are removed,
- the site feels premium and readable,
- advanced ideas are labeled honestly,
- and you provide an exact closing report with verified command outputs.

10. Launch acceptance checklist

- The active build command completes successfully.
- If lint exists, it passes. If typecheck exists, it passes.
- All core routes render cleanly.
- One shared shell is used across the route tree.
- Navigation, route metadata, and status labels come from one canonical source.
- Duplicate pages/components/dead files are removed.
- Anything not implemented is labeled honestly.
- The homepage explains the hierarchy quickly.
- The site looks expensive, restrained, and readable on desktop and mobile.

11. Bottom line

Your best finished product is not 'Iron Man on a website.' It is better than that: a believable, high-status, premium technology company interface that feels investor-grade, founder-grade, and operator-grade. The site should communicate command, architecture, and discipline. That is what makes it look expensive.
